HRCT SCAN OF THE CHEST

An HRCT study is performed using 0.6 mm slice collimation on a Siemens 32 slice spiral MDCT scanner. Non-ionic contrast has not been administered.

Multiple areas of ground glass attenuation with associated interstitial septal thickening seen in both lung fields.

Lobes	Involvement	Score
Right upper lobe	50-75%	4
Right middle lobe	50-75%	4
Right lower lobe	50-75%	4
Left upper lobe	25-50%	3
Left lower lobe	25-50%	3
Total score		18/25

The pleural spaces are normal bilaterally. No pleural effusion or thickening is noted.

The mediastinum appears to be normal. No mediastinal adenopathy or mass lesion is noted.

No pericardial effusion is noted.

Bones and soft tissues are unremarkable. No e/o any significant anterior chest wall abnormality.

IMPRESSION:

- **Multiple areas of ground glass attenuation with associated interstitial septal thickening in both lung fields –** ***suggestive of infective etiology – suspicious for Covid-19 related pneumonitis in view of present pandemic scenario (CORADS: 5) (CT severity score: 18/25 → severity: severe → progressive stage).***
